

# Builder Pattern

---

**Bryan Hansen**

Director of Software Development

@bh5k

# Concepts

**Handles complex constructors**

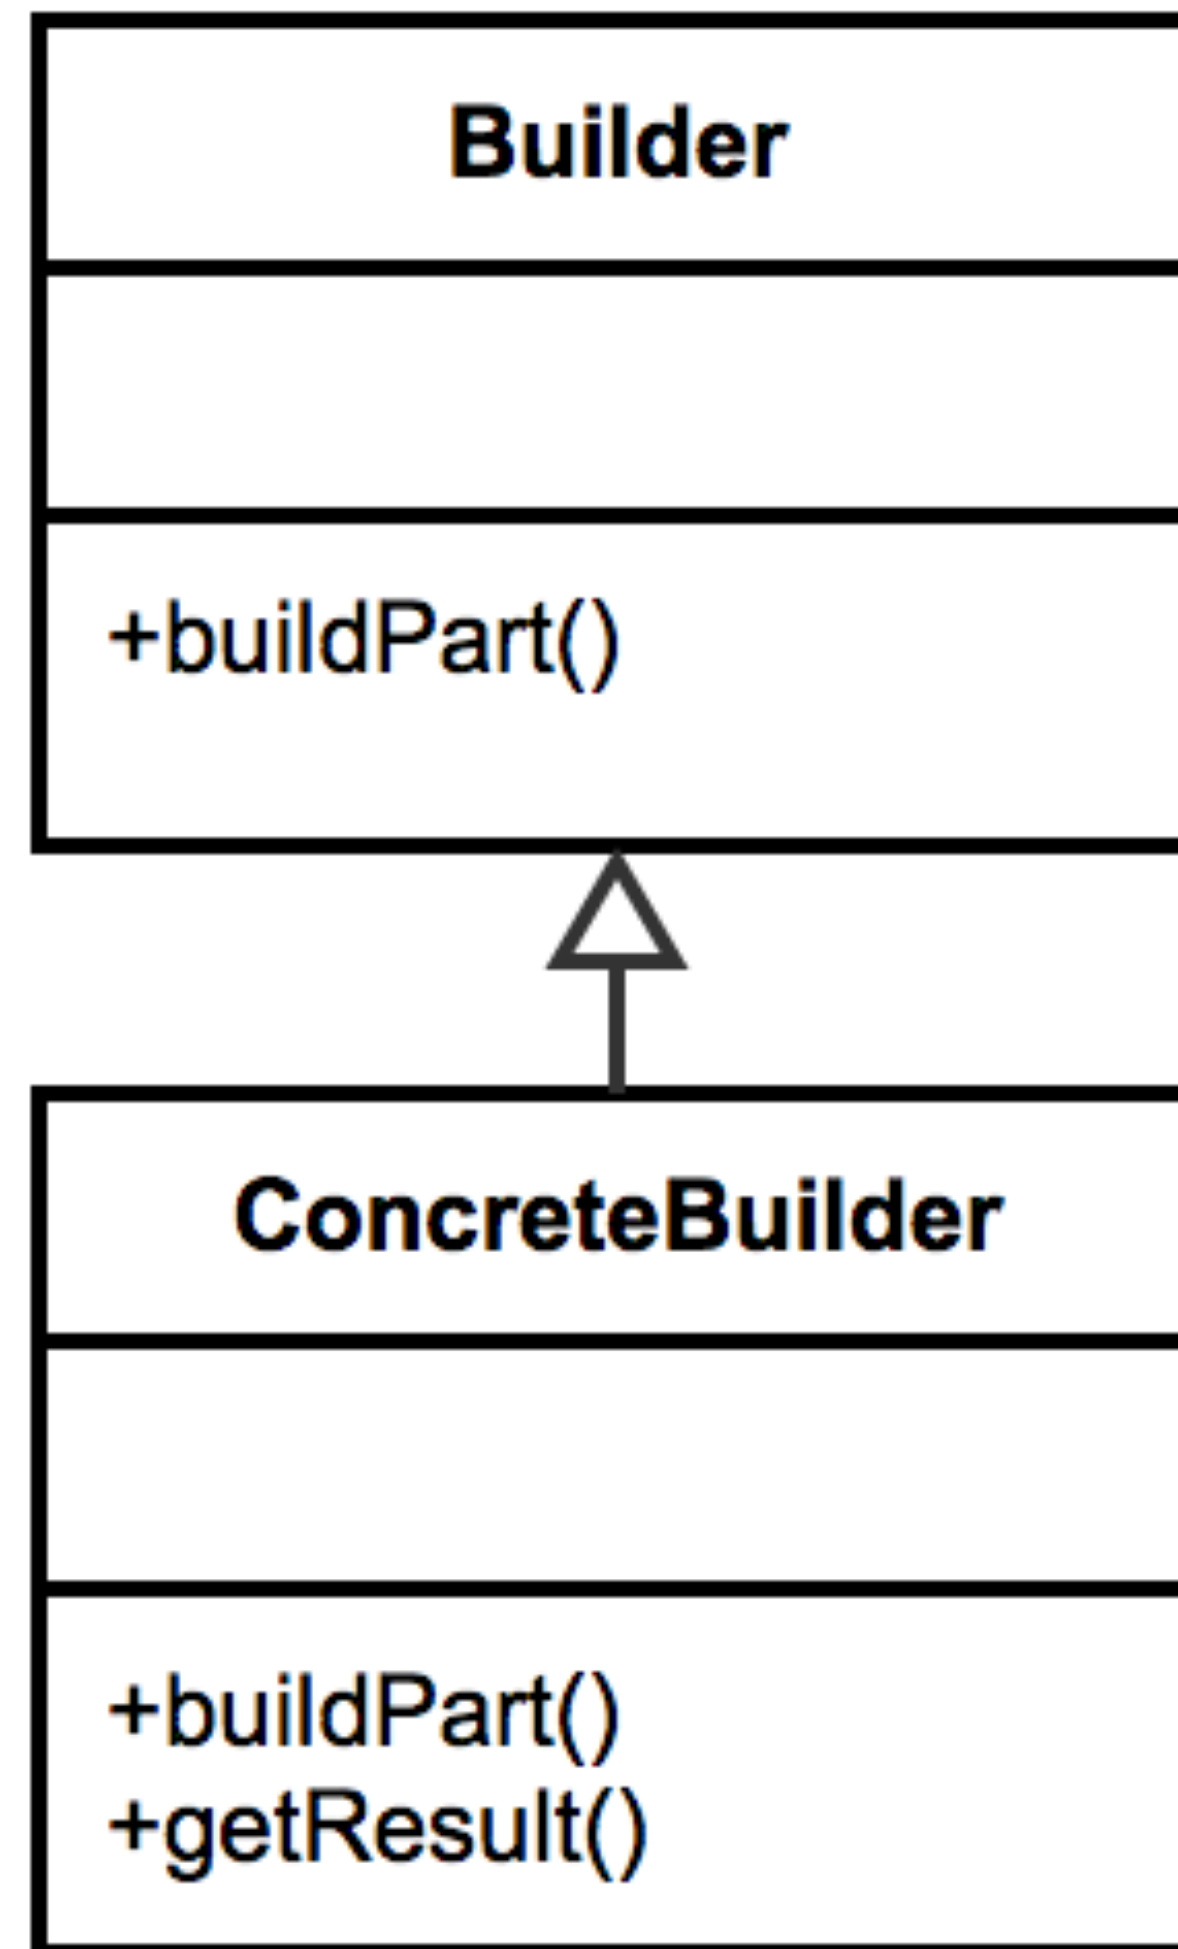

**Large number of parameters**

**Immutability**

**Examples:**

- **StringBuilder**
- **DocumentBuilder**
- **Locale.Builder**

# Design

**Flexibility over telescoping constructors**

**Static inner class**

**Call appropriate constructor**

**Negates the need for exposed setters**

**Java 1.5+ can take advantage of Generics**

# Everyday Example - StringBuilder

```
StringBuilder builder = new StringBuilder();  
  
builder.append("This is an example ");  
  
builder.append("of the builder pattern. ");  
  
builder.append("It has methods to append ");  
  
builder.append("almost anything we want to a String. ");  
  
builder.append(42);
```

# Demo

**Demonstrate Exposed Setters**

**Demonstrate Telescoping Constructors**

**Create Builder**

**Build Out Example**

# Pitfalls

**Immutable**

**Static Inner class**

**Designed first**

**Complexity**

**Method returns object**

# Contrast

## **Builder**

**Handles complex constructors**

**No interface required**

**Can be a separate class**

**Works with legacy code**

## **Prototype**

**Implemented around a clone**

**Avoids calling complex constructors**

**Difficult to implement in legacy code**

# Summary

**Creative way to deal with complexity**

**Easy to implement**

**Few drawbacks**

**Can refactor in with separate class**
